Comment
Profile Page: Profile page of the user where they can see/edit/delete all their posts. They can change the default cover/profile images.

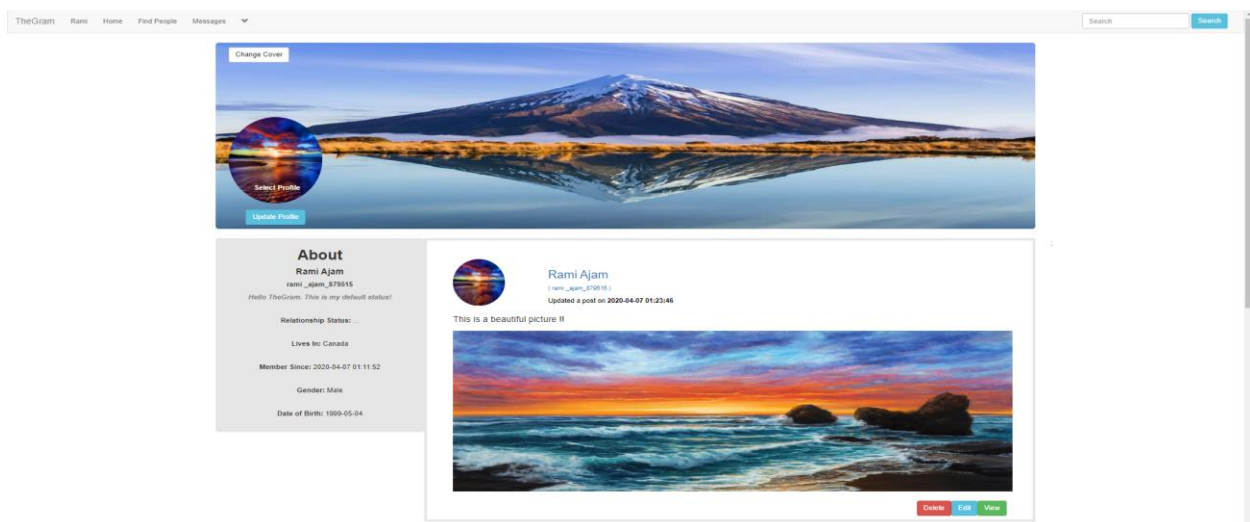

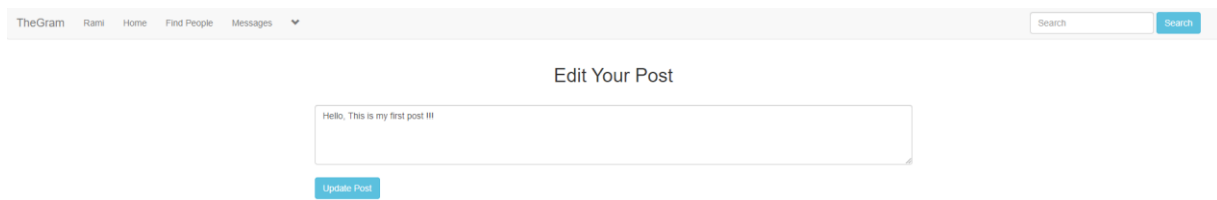

This is the profile page after the user changes their profile/cover pages

Edit_Post Page: The user will be able to edit their posts after clicking on the "edit" button found under the post

This is after using the edit button on the first post we posted.

Delete Button: After the user clicks on the "delete" button, a pop-up will show and the post will be deleted. (We used the delete button on 2 of the 3 images which is why only one shows)
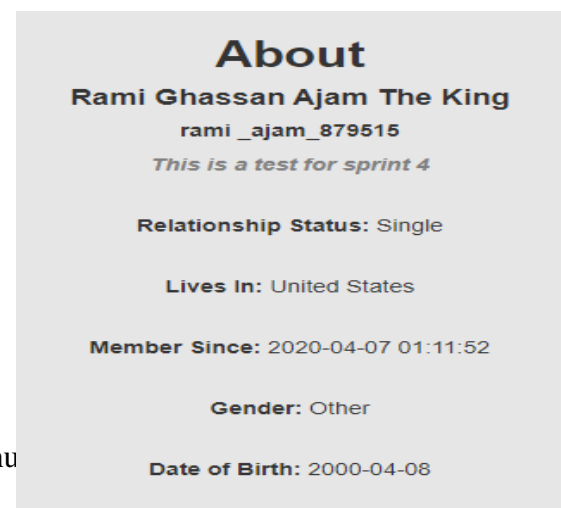

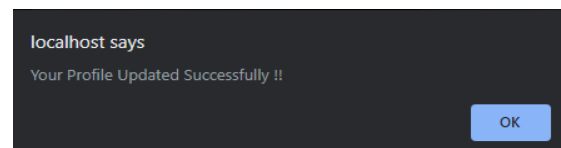

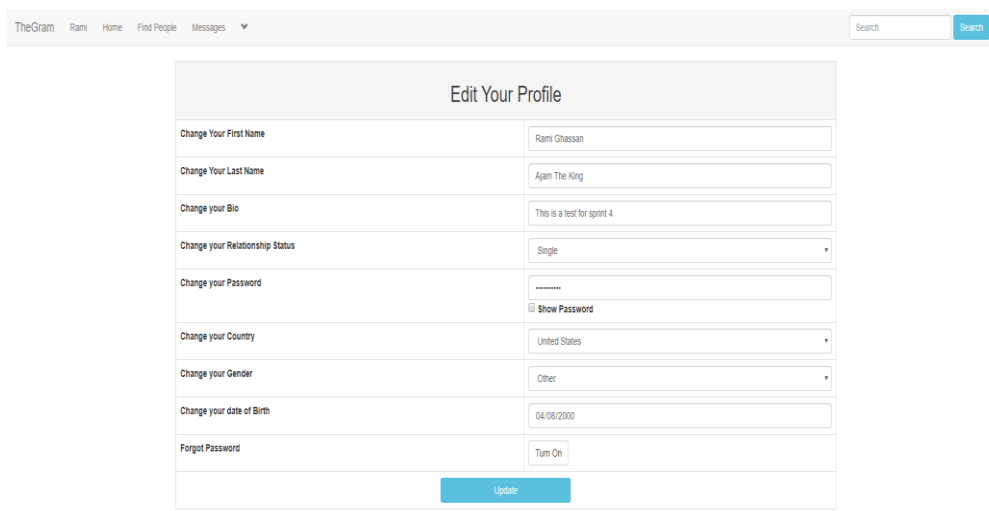

Edit Profile: The user is able to edit their profile information by

Clicking on the "edit account" button found in the drop-down menu

Find People Page: The user will be to search for other users to see their profile by clicking on the "Find People" button. If the user clicks on their name, it will take them to their own profile page.

**Search Bar:** When the user writes the name (or a part of it) of the other user, the results will only show the users with a similar name
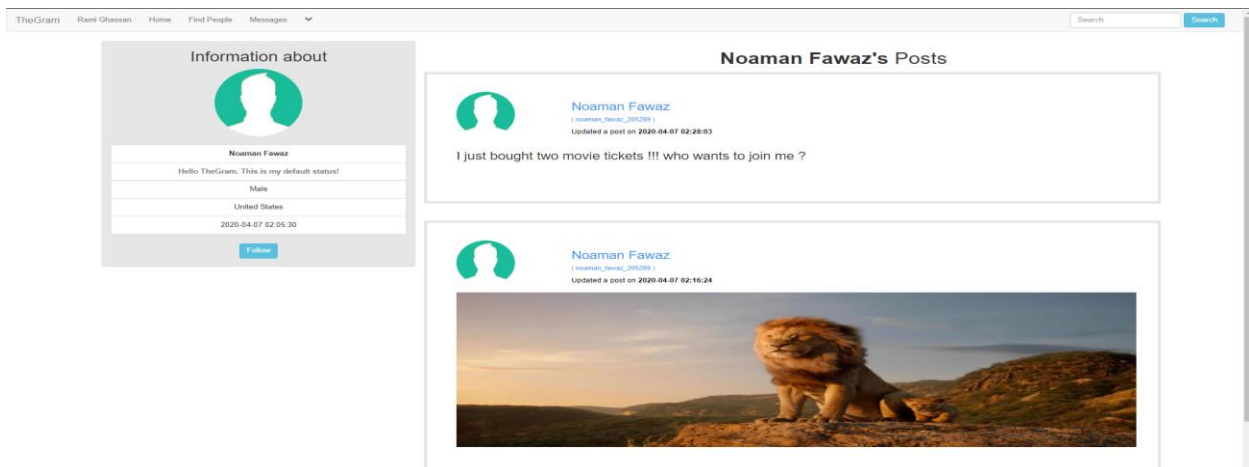

User_Profile Page: When the user clicks on the other user's picture or name in the find people page, they will be redirected to this page to see information about the user with some of his/her posts (but they cant comment on it). Additionally, they will be offered the chance to follow the user so they can view their posts on the news feed or add a comment.
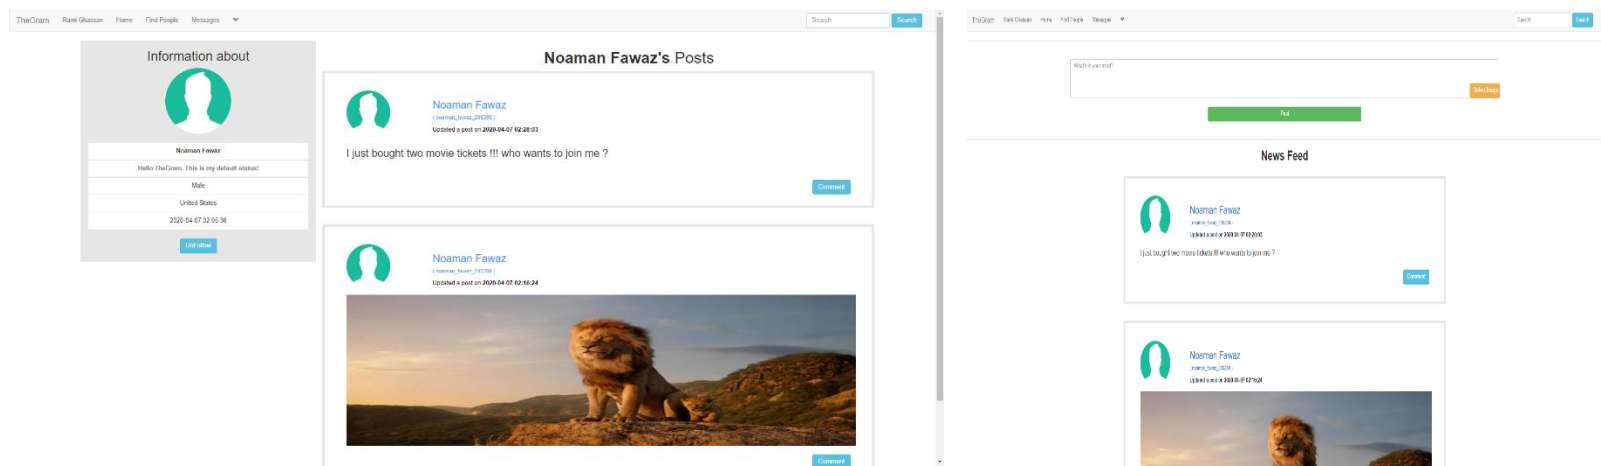

Follow Button: When the user clicks the follow button, the button changes to "unfollow" and now the user will be able to add comments to the pictures. Also, the user will be able to see Noaman's posts on his news feed in the home page.
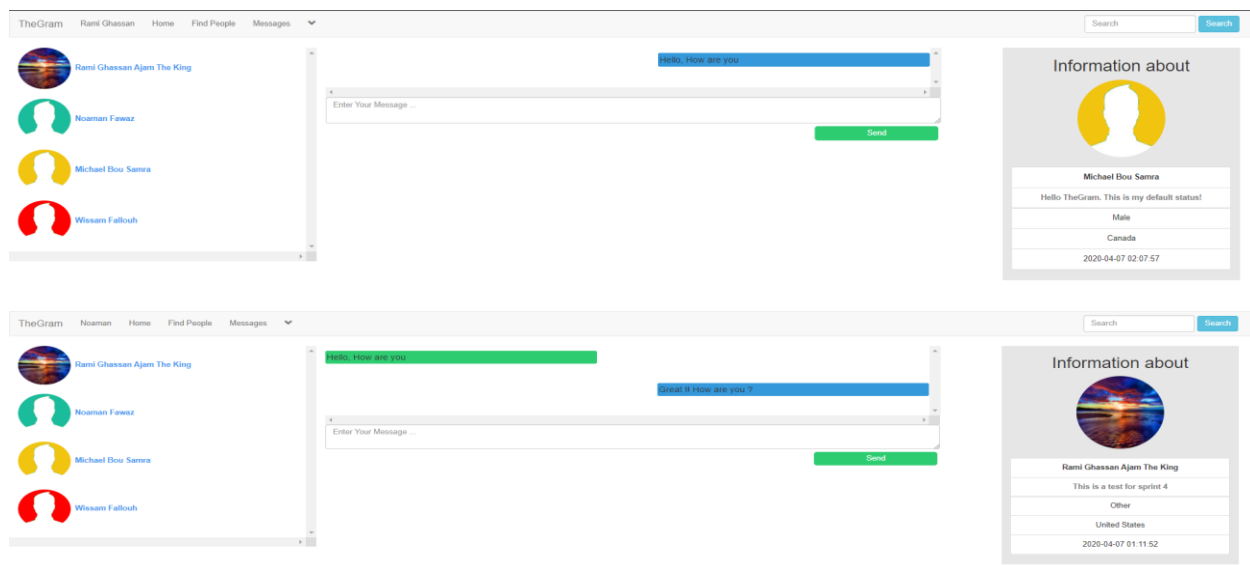

Messages: The user will be able to click on any other user to send a message and the other will be able to answer back if he/ she wanted or not.
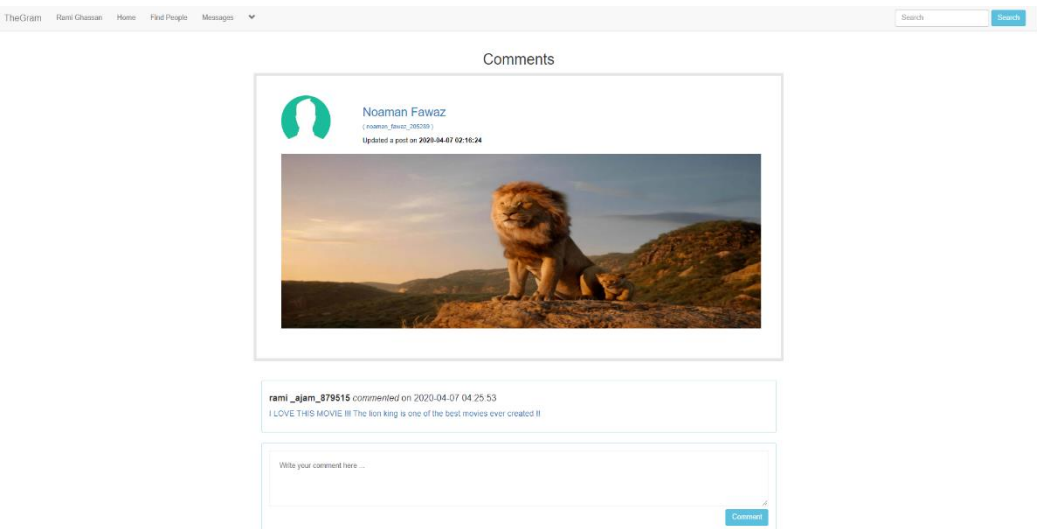

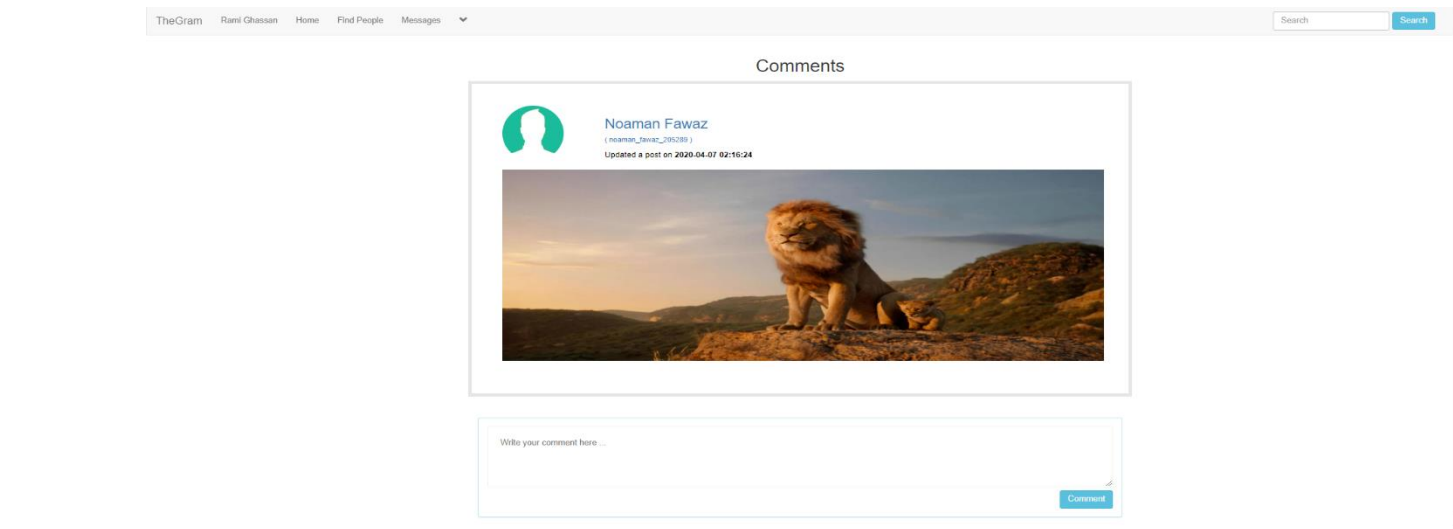

Notes To Consider:

- The messages feature is created exactly to allow any user to message any other user. it has nothing to do with following the user or not.
- If we want to add the following/ not following idea to the messages feature, then we will have to create another feature that is related to privacy (private/ public) which we didn't.
- In this application, we are assuming everyone is public (no private accounts)
- The follow feature only helps to see the other user's posts on the news feed instead of going to their page every time.
